REPORT ON THE SECONDARY MARKET FOR RGGI CO₂ ALLOWANCES: FIRST QUARTER 2022

Prepared for:

RGGI, Inc., on behalf of the RGGI Participating States

Prepared By:

POTOMAC ECONOMICS

May 2022
This report was prepared by Potomac Economics (the contractor) in the course of performing work contracted for and sponsored by RGGI, Inc. on behalf of the RGGI Participating States (Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, Vermont, and Virginia). The opinions expressed in this report do not necessarily reflect those of RGGI, Inc. or any of the Participating States, and reference to any specific product, service, process, or method does not constitute an implied or expressed recommendation or endorsement of it. Further, RGGI, Inc., the Participating States, and the contractor make no warranties or representations, expressed or implied, as to the fitness for particular purpose or merchantability of any product, apparatus, or service, or the usefulness, completeness, or accuracy of any processes, methods, or other information contained, described, disclosed, or referred to in this report. RGGI, Inc., the Participating States, and the contractor make no representation that the use of any product, apparatus, process, method, or other information will not infringe privately owned rights and will assume no liability for any loss, injury, or damage resulting from, or occurring in connection with, the use of information contained, described, disclosed, or referred to in this report.

The Regional Greenhouse Gas Initiative (RGGI) was the first mandatory market-based regulatory initiative in the U.S. to reduce greenhouse gas emissions. The Regional Greenhouse Gas Initiative (RGGI) is a cooperative effort of Eastern states of the US to reduce emissions of carbon dioxide (CO₂) from the power sector.

RGGI, Inc. is a non-profit corporation created to provide technical and administrative services to the states participating in the Regional Greenhouse Gas Initiative.
A. INTRODUCTION AND SUMMARY

The primary market for RGGI CO₂ allowances consists mainly of the auctions where allowances are initially sold. Once a CO₂ allowance is purchased in the primary market, it can then be resold in the secondary market. The secondary market for RGGI CO₂ allowances comprises the trading of physical allowances and financial derivatives, such as futures and options contracts.

The secondary market is important for several reasons. First, it gives firms an ability to obtain CO₂ allowances at any time during the three months between the RGGI auctions. Second, it provides firms a way to protect themselves against the potential volatility of future auction clearing prices. Third, it provides price signals that assist firms in making investment decisions in markets affected by the cost of RGGI compliance.

This report provides a summary of activity in the secondary market in the first quarter of 2022 and discusses the results of our market power screens.

- **Secondary Market Activity:** The volume of trading increased from the same quarter of the previous year.
  - Physical allowance transfers between unaffiliated firms totaled 22 million in the first quarter of 2022, which was 18 percent higher than the first quarter of 2021 but down 75 percent from the fourth quarter of 2021. More transactions took place in the fourth quarter of 2021 because of the settlement of the benchmark futures contract at the end of December.
  - The volume of trading of RGGI futures was 72 million CO₂ allowances in the first quarter of 2022, which was 28 percent higher than in the first quarter of 2021.
  - Open interest in RGGI futures and options decreased from 87 million allowances at the end of the previous quarter to 79 million allowances by the close of the first quarter of 2022.
  - Increased futures trading and open interest over the last few quarters has coincided with increased participation of money managers and swap dealers in the futures market.

- **CO₂ Allowance Prices:** After rising appreciably in the second half of 2021, prices stabilized in January and February of 2022 and then fell significantly in March. In January and February, prices remained close to the Cost Containment Reserve (“CCR”) Trigger Price for 2022 of $13.91. The CCR tends to reduce price volatility by increasing allowance supply when auction clearing prices reach the Trigger Price. In early March, after the interim compliance deadline, prices trended lower with most transactions between $12.50 and $13.50.
Prices remained near $14 from the beginning of the quarter through the end of February. In March, following the interim compliance deadline, prices began to fall ending the quarter near $13.

Auction 55 took place on March 9th and cleared at $13.50, lower than the CCR of $13.91.

The strike prices for call options have ranged from $15 and $20 during the first quarter. Option-implied price volatility remained high compared to the previous quarter, although there were fewer option trades.

**CO₂ Allowance Holdings** – At the end of the first quarter of 2022:

- There were 167 million CO₂ allowances in circulation.
- Compliance-oriented entities held approximately 70 million of the allowances in circulation (42 percent).
- Approximately 77 million of the allowances in circulation (46 percent) are believed to be held for compliance purposes.

We evaluate information on the holdings of CO₂ allowances and allowance derivatives as well as the demand for allowances to identify firms that may have acquired a position that raises competitive concerns. In the current study period, we find no evidence of anticompetitive conduct.
B. BACKGROUND

The secondary market for RGGI CO₂ allowances comprises the trading of physical allowances and financial derivatives, such as futures, forward, and option contracts. A physical allowance trade occurs when the parties to the transaction register the transfer of ownership in RGGI’s CO₂ Allowance Tracking System (“COATS”). Financial derivatives include any contracts whereby parties agree to exchange funds and/or allowances at some future date, depending in many cases on factors such as the price of allowances at some future date. Many financial derivatives eventually result in the transfer of physical CO₂ allowances (i.e., the transfer is registered in COATS), but this may occur months or years after the parties enter into a financial transaction. These include the following types of transactions:

- **Futures** – Under these contracts, two parties agree to exchange a fixed number of CO₂ allowances of a certain vintage year at a particular price at a specific point in the future (called the “delivery month”). At the end of the delivery month, the contracted number of CO₂ allowances must be physically transferred to the buyer’s account in the COATS registry and funds must be transferred to the seller. Allowances transferred must be usable for compliance in the vintage year of the futures contract. One standard futures contract equals 1,000 RGGI allowances.¹ These contracts are listed by an exchange with simple standardized terms to promote liquidity.

- **Forwards** – These are like futures contracts, but a forward contract typically requires that all financial settlement occur at expiration. These contracts can be made off an exchange between two parties, allowing the parties to agree to less standardized terms.

- **Call Options** – Call options give the purchaser the option to buy a fixed number of CO₂ allowances of a certain vintage year at a particular strike price at the expiration date. For example, suppose a firm holds a call option with $5 strike price, and December 2021 expiration date. If the price of the corresponding forward contract rose to $5.75, the firm could exercise the option to buy CO₂ allowances at $5 and immediately sell them at $5.75. Alternatively, if the price of the forward contract stayed below $5, the firm would let the option expire without exercising it. One standard options contract can be exercised for 1,000

---

¹ More precisely, a futures contract requires parties with an open interest to post financial assurance in an account with the exchange until the contract reaches expiration. The exchange continually withdraws and deposits funds according to changes in the prices of the contracts in which the party has interest. For example, if a firm buys a contract for 1,000 allowances at $3.50/allowance, the purchasing firm (firm with a long position) must put $3,500 in an account (or whatever share of the entire liability the exchange requires). If the futures price declines to $3/allowance, the exchange transfers $500 from the account of a firm with a long position to the account of a firm with a short position (firm that sold a contract), and the firm with a long position is only required to keep $3,000 in the account. At the end of the delivery month, allowances are exchanged for funds according to the closing price on the last day of the month.
RGGI allowances. Currently, call option contracts listed on both ICE and Nodal Exchange are European style, meaning that they cannot be exercised before the expiration date.

- **Put Options** – Put options are similar to call options but they give the purchaser the option to sell a certain number of CO2 allowances of a particular vintage year at a specified strike price any time prior to the expiration date. Currently, put option contracts listed on both ICE and Nodal Exchange are European style, meaning that they cannot be exercised before the expiration date.

Futures, forward, and option contracts allow firms to manage risks associated with unforeseen swings in commodity prices. Futures and forwards allow firms to lock-in the prices of future purchases or sales. Options allow firms to limit their exposure to price volatility. Call options protect the purchaser if the price of the commodity increases, while put options protect the purchaser if the price of the commodity decreases. Although options provide less certainty than futures and forward contracts, they generally require less financial security since they do not obligate the holder to exercise the contract if its value declines, which could make them more attractive to some firms.

The terms of futures, forward, and option contracts vary in the degree to which they are standardized. “Exchange-traded” contracts typically have the most standardized provisions, while the term “over-the-counter” (“OTC”) is applied to contracts with less standardized provisions. However, OTC contracts, once entered into, are often settled through a clearinghouse in order to protect the parties from the risk that the counterparty defaults.

The amount of open interest is the net amount of futures, forwards, or options that have been traded for a contract with a particular set of specifications (i.e., vintage year, delivery month, etc.), but have not reached the time of delivery, expired, or been exercised. For example, if Firm A sells 100 contracts of a particular type to Firm B, Firm A will have a short position of 100 contracts, Firm B will have a long position of 100 contracts, and the total open interest for the particular type of contract will be 100 contracts. Hence, the total open interest can be determined by summing across all of the long positions of market participants or by summing across all of the short positions.

The volatility of a CO2 allowance refers to the expected standard deviation of the distribution of allowance prices one year in the future. For example, if the expected value of the price one year
in the future is $1 and the option-implied volatility is 25 percent, this implies that the probability
that the price will be within 25 percent of $1 (i.e., between $0.75 and $1.25) is 68.2 percent
assuming that the price is distributed log-normally. Option-implied volatility refers to volatility
estimates that are derived by analyzing the price and other terms of an option contract compared
with the price of CO2 allowances.

**Categories of Firms Participating in the RGGI Market**

Participation in the RGGI market involves many different firms with various interests in RGGI
allowances. Some participate in order to satisfy compliance obligations, others have investment
interests, and still others participate for both purposes. To more effectively track the activity of
different participants, we use several classifications for participant firms. Figure 1 summarizes
the relationship between these classifications.

**Figure 1: Classifications of Participant Firms in the RGGI Marketplace**

- **Compliance-oriented entities** are compliance entities that appear to acquire and hold
  allowances primarily to satisfy their compliance obligations.

- **Investors with Compliance Obligations** are firms that have compliance obligations, but which
  hold a number of allowances that exceeds their estimated compliance obligations by a margin
  suggesting they also buy for re-sale or some other investment purpose. These firms often
  transfer significant quantities of allowances to unaffiliated firms.

- **Investors without Compliance Obligations** are firms without any compliance obligations.
These three categories form the basis for two overlapping groups.

- **Compliance Entities** – All firms with compliance obligations, and their affiliates.\(^2\) Combines the first and second of the above categories.
- **Investors** – All firms which are assessed to be purchasing primarily for investment rather than compliance purposes. Combines the second and third of the above categories.

The assessment of whether a compliance entity holds a number of allowances that exceeds its compliance obligations by a margin that suggests they are also buying for re-sale or some other investment purpose is based on: (a) the entity’s forecasted share of the total compliance obligations for the entire RGGI footprint through 2026, (b) the total number of allowances in circulation, and (c) consideration of the pattern of the entity’s allowance transfers to unaffiliated firms versus affiliated firms. Since the designation of a compliance entity as an investor is based on a review of its transactions and holdings, the designation of a particular firm may change over time as more information becomes available. Therefore, some of the quantities in this report may not match previous reports because of changes in the classification of particular firms.

The number of allowances that are believed to be held for compliance purposes includes 100 percent of the allowances held by compliance-oriented entities and a portion of allowances held by other compliance entities (i.e., entities with compliance obligations that are not included in the compliance-oriented category).

---

\(^2\) Affiliates are firms that: (i) have a parent-subsidiary relationship with a compliance entity, (ii) are subsidiaries of a parent company that has a large interest in a compliance entity, (iii) have substantial control over the operation of a budget source and/or responsibility for acquiring RGGI allowances to satisfy its compliance obligations.
C. SUMMARY OF PRICES

This section summarizes prices in the secondary market for RGGI CO₂ allowances in the first quarter of 2022. Figure 2 summarizes transaction prices in the secondary market for CO₂ allowances, including the prices of allowance transfers registered in COATS\(^3\) and the prices of futures contract trades on the Intercontinental Exchange (“ICE”) and on the Nodal Exchange (“NEX”). Figure 3 analyzes the trading of options for RGGI allowance futures which firms use to hedge exposure to fluctuations in allowance prices.

Key observations regarding RGGI CO₂ allowance prices:

- After a period of rising prices in the second half of 2021, prices stabilized in January and February 2022 near the 2022 CCR Trigger Price of $13.91. In March, the end of the quarter, prices fell to about $13.
- Prices of COATS transfers were generally consistent with futures prices during the quarter.
- The clearing price in Auction 55 (on March 9) settled below the CCR trigger price level of $13.91 at $13.50/ton. This was consistent with secondary market prices at the time. After Auction 55, prices in the secondary market never exceeded $13.50/ton.
- Five call options were traded with strike prices between $15.00 and $20.00. All five of these trades were for settlement in December of 2022. Though there were relatively few trades in the first quarter, option trading patterns indicate that some firms were seeking protection from large upward movements in allowance prices.

Prices of CO₂ Allowances and Allowance Derivatives

Figure 2 summarizes prices in the secondary market during the period. The blue diamonds show the price of futures trades on ICE, and orange diamonds show futures trades on Nodal Exchange on days with trading volume. The green triangles show the volume-weighted average prices of physical deliveries registered in COATS on days with transactions when the price was recorded (“COATS transactions”). The red circle shows the clearing price of the CO₂ allowances that were sold in RGGI Auction 55, which was held on March 9. Figure 2 also shows volume-weighted average prices for each category in the first quarter of 2022 compared to the previous

---

\(^3\) Parties are required to report the transaction price if there is an underlying financial transaction related to the transfer of allowances between accounts.
quarter and the first quarter of the previous year. CO₂ allowances that are usable for compliance in the fifth control period are shown.

**Figure 2: Prices in the Secondary Market for RGGI CO₂ Allowances**

January 1 to March 31, 2022

Key observations regarding CO₂ allowance prices:

- In January and February, prices remained at about $14/ton, just above the 2022 CCR Trigger Price of $13.91. In March, just after the interim compliance deadline, prices declined slightly to around $13 by the end of the quarter. Prices of COATS transfers were generally consistent with futures prices throughout the quarter with the exception of a few outliers. These instances can result when pricing terms are agreed to in advance of the actual transaction date.

- The clearing price in Auction 55 (March 9) was $13.50/ton, which was relatively consistent with secondary market prices in the days leading up to and immediately following the auction. In Auction 55, the clearing price was below the CCR trigger price of $13.91.

Sources: Auction clearing prices are available [here](#), ICE futures prices are available [here](#), NEX futures prices are available [here](#), and the prices of physical deliveries are based on information in COATS. Futures prices are shown for the prompt month contract settlement price even if the volume traded was for another contract. Average COATS Transfer Prices for previous quarters have been updated to reflect transactions reported after the compilation of data for previous quarterly reports.
**Prices of Options for CO₂ Allowances**

The clearing prices of option contracts provide insight about how the market expects the price of the underlying commodity to move in the future. The price of an option depends on two factors: (i) the expected value of the underlying commodity relative to the strike price of the option, and (ii) the expected volatility of the underlying commodity over the period before the expiration date. When call option price decreases coincide with put option price increases, it signals a decrease in the expected price of the underlying commodity. Conversely, when call option prices and put option prices move in the same direction, it signals a change in the expected volatility of the underlying commodity price.

Key observations regarding the pricing of options for CO₂ allowances:

- Five option trades were recorded on ICE in the first quarter, which was down from thirty-one in the previous quarter.
- Five call options and zero put options were traded with strike prices between $15.00 and $20.00. All of these trades were for settlement in December of 2022. This activity suggests that some market participants are seeking protection from the risk of upward movements in RGGI allowance prices.

**Volatility of CO₂ Allowance Prices**

Market-based emissions reduction initiatives such as RGGI are designed to give firms efficient incentives to reduce or offset emissions. In the short-term, high-emitting generators will operate less frequently in favor of low-emitting generators. In the long-term, the market will affect the decisions of firms to develop offset projects, retire older inefficient generation, and perform maintenance that increases fuel efficiency and lowers carbon-intensity. Predictable CO₂ allowance prices decrease the risks associated with making long-term investments in reducing CO₂ emissions. Since CO₂ allowance prices can be volatile, the availability of futures and options contracts allows firms to protect themselves from the risks of such investments.

Expected price volatility is affected by elements of RGGI that promote allowance price stability. Potential upward price movements are limited by the Cost Containment Reserve (“CCR”), which allows for the sale of a fixed number of allowances in addition to the cap if the auction clearing
price reaches the CCR Trigger Price.\textsuperscript{5} Potential downward price movements are limited by the Reserve Price, which currently prevents allowances from being sold in the auction at a price below $2.44, and the Emissions Containment Reserve ("ECR"), which withholds allowances from circulation if prices fall below an established trigger price.\textsuperscript{6}

One measure of the volatility of CO\textsubscript{2} allowance prices is known as option-implied volatility, which measures the volatility that is implied by the trading of option contracts for CO\textsubscript{2} allowances. If a firm perceives that CO\textsubscript{2} allowance prices are volatile, the firm may be willing to pay a high price for an option contract that protects it from unforeseen allowance price fluctuations. Likewise, if a firm perceives that CO\textsubscript{2} allowance prices are relatively stable, the firm will be willing to pay relatively little for the same option contract. Figure 3 shows the option-implied volatilities of option trades over the most recent six-month period.

Observations regarding the option-implied volatility of CO\textsubscript{2} allowance prices shown in Figure 3:

- In October, volatility was about 45 percent, and then jumped to around 55 percent in December. In January and February, volatility fell to 50 percent, and then to 44 percent in March.
- Overall, option-implied volatility levels averaged 49 percent in first quarter of 2022, identical to the previous quarter.
- As allowance prices approached the Cost Containment Reserve trigger price, $13.91/ton in 2022, price variations have been reduced. The CCR will continue to help reduce price volatility in 2022.

\textsuperscript{5} In 2022, the sizes of the CCR and the CCR trigger price was set in accordance with the 2017 Model Rule. The CCR trigger price was set at $13.91 in 2022 and will rise 7 percent each year. Details are provided here.

\textsuperscript{6} In 2021, the initial size of the ECR was set equal to 10 percent of the budgets of states implementing the ECR. Subsequently, the ECR trigger price will rise 7 percent each year and is set at $6.42 in 2022. Details are provided here.
Trades conducted within 90 days of a contract’s expiration are excluded from the option-implied volatility calculation. While options typically expire on the third Friday of the expiration month, the 15th is used as a proxy for the expiration date. For example, a transaction date of September 15 with an expiration of December 15 of the same year would be excluded.
D. VOLUMES AND OPEN INTEREST

This section evaluates the volume of COATS transactions (i.e., transfers of CO₂ allowances between unaffiliated parties as recorded in COATS) as well as the volume of trading and the level of open interest in exchange-traded futures and options. Figure 4 examines the volumes of transactions recorded in COATS and of futures trading. Figure 5 summarizes the level of open interest in exchange-traded RGGI futures and option contracts. Figure 6 evaluates the concentration of firms with open interest in exchange-traded RGGI futures and option contracts. Figures 7 and 8 show the levels of participation in the market for exchange-traded RGGI futures and option contracts by various categories of firms.

Key observations regarding trading volumes and open interest in the first quarter of 2022:

- Futures trading volume was 72 million CO₂ allowances in the first quarter of 2022, down from 169 million in the fourth quarter and up from 56 million in the first quarter of 2021.

- Physical allowance transfers between unaffiliated firms totaled 22 million in the first quarter of 2022, 75 percent lower than the previous quarter, but 18 percent higher than the first quarter of 2021.

- Open interest in RGGI futures and options decreased from 87 million allowances at the end of 2021 to 79 million by the close of the first quarter of 2022. Money managers and swap dealers continued to be active after notable increases in 2021, but there was some decline in swap dealers’ positions by the end of the quarter.

- There were 167 million CO₂ allowances in circulation at the end of the quarter. Compliance-oriented entities held approximately 70 million of the allowances in circulation (42 percent). Approximately 77 million of the allowances in circulation (46 percent) are believed to be held for compliance purposes.

Volume of CO₂ Allowance Transfers, Futures, and Options

Figure 4 summarizes the volume of transfers of CO₂ allowances between the COATS accounts of unaffiliated firms and the volume of trading of RGGI futures listed on ICE and NEX.\(^8\) The figure also shows the volume of transfers in the first quarter of 2022 compared to the previous quarter and to the first quarter of 2021. The volume of futures trading and transfers of CO₂ allowances...
allowances for each control period are shown together because all CO₂ allowances are interchangeable for compliance purposes.

Key observations regarding physical CO₂ allowance transfers between unaffiliated firms:

- The volume of CO₂ allowance transfers between unaffiliated firms was 22 million, 75 percent lower than the previous quarter, but 18 percent higher than the first quarter of 2021.
- More CO₂ allowance transfers occurred in the last few business days of the month when futures contracts settle, reflecting that most result from settlement of futures contracts.

Key observations regarding the volume of trading of RGGI futures and options contracts:

- The total volume of RGGI futures trading was 72 million allowances in the first quarter of 2022, less than half of the fourth quarter 2021 trading volume, but 28 percent higher than the first quarter 2021 trading volume.
- Of futures trading volumes during the first quarter of 2022, approximately 69 percent was for contracts that settled in December 2022.
**Open Interest in Exchange-Traded RGGI Futures and Options**

Figure 5 summarizes the level of open interest in exchange-traded futures and options listed on ICE and Nodal Exchange during the first quarter of 2022. The red line shows the level of open interest in futures contracts on ICE. The teal line shows the level of open interest in futures contracts on NEX. The green line shows the level of open interest in call options on ICE. The blue line shows the level of open interest in put options on ICE. The orange line shows the level of open interest in auction futures on ICE, while the purple line shows NEX call options.

Key observations regarding the level of open interest in RGGI futures and options:

- The total open interest in RGGI futures on ICE decreased from 74 million allowances at the end of the fourth quarter of 2021 to 65 million by the close of the fourth quarter of 2022. Open interest in RGGI futures on Nodal Exchange remained at about 12 million between the close of the fourth quarter of 2021 and the close of the first quarter of 2022.
- Open interest in RGGI put options on ICE remained at 0.2 million, and open interest in call options on ICE rose slightly from 1.0 to 1.4 million. Open interest in call and put options on Nodal Exchange were 0.2 million and zero, respectively, at the end of the first quarter.
Overall, the level of open interest across RGGI options and futures products decreased by 9 percent from the close of the fourth quarter of 2021 to the close of the first quarter of 2022 but increased by 39 percent compared to the first quarter of 2021.

RGGI Auction Futures\(^9\) had zero open interest throughout the quarter.

**Concentration of Open Interest**

Additional information about the trading of futures, forwards, and options is available in the weekly Commitments of Traders ("COT") reports, which are published by the Commodity Futures Trading Commission ("CFTC")\(^{10}\) for each week when greater than 20 firms have reportable positions in a particular product.

Figure 6 summarizes the concentration of open interest in 2021 and 2022 vintage ICE futures and options contracts reported during the quarter by the CFTC. The figure reports the net long positions in three categories: (i) the four firms with the largest long positions, (ii) the four firms with the largest long positions not including the Top 4, and (iii) all other long positions. The figure also reports the net short positions in three categories: (i) the four firms with the largest short positions, (ii) the four firms with the largest short positions not including the Top 4, and (iii) all other short positions.

---

\(^9\) RGGI Auction Futures are a product which converts to long or short RGGI futures contracts on the day of publication of the Market Monitor Report for a specific auction. Positions opened in the RGGI futures contract will be priced at the Auction Clearing Price as specified in the Market Monitor Report. The futures contract vintage will be the month and year in which the auction is held. For more information see [here](#).

\(^{10}\) Each day, firms with an open interest of 25 contracts or more must report their positions to the CFTC. Each Tuesday, the CFTC issues the COT report summarizing the long and short positions of market participants.
Key observations regarding the concentration of open interest:

- Although many firms have open interest in RGGI CO₂ allowance futures and options, a small number of firms account for large shares of the net long and short positions in 2021 and 2022 Vintage contracts.

- Open interest in 2022 Vintage contracts fell by 12 percent from the start of the quarter:
  - The “Top Four” Firms’ concentration in net long positions in 2022 Vintage contracts rose from 61 percent at the beginning of January to 64 percent in mid-February and then fell to 56 percent by the end of March, while the concentration in net short positions was stable from 84 percent in January to 85 percent at the end of March.
  - On a weekly basis, the “Top Four” Firms accounted for an average of 61 percent (not weighted by volume) of the total net long positions in 2022 Vintage contracts during the quarter, while 84 percent of the total net long positions were held by eight firms.
  - On a weekly basis, the “Top Four” Firms accounted for an average of 82 percent (not weighted by volume) of the total net short positions in 2022 Vintage contracts during the quarter, while 93 percent of the total net short positions were held by eight firms. However, both the “Top Four” and the “Next Four” (inclusive of the “Top Four”) achieved 56 percent (the lowest share of the quarter) and 82 percent (the same as at the start of the quarter) of total interest by the end of March.
The “Next Four” largest short firms accounted for a relatively small amount (typically 10 percent) of net short open interest, indicating that some of these firms also hold long positions in 2022 vintage contracts. For example, if a compliance entity with a long position for the prompt month does not have an immediate need to hold allowances, the firm may sell futures for the prompt month while buying futures for settlement in a month that is closer to the compliance deadline.

**Participation in the Market for RGGI Derivatives**

Figure 7 summarizes the concentration of open interest by category of trader as defined by the CFTC: producers/merchants, swap dealers, money managers, spread, and other, which includes the CFTC’s categories of “Other” and “Non-reportable.” Producers/merchants represent the group of traders who use futures markets to hedge risks associated with their own production or ‘handling’ of RGGI allowances. This category most closely aligns with the compliance entity category used in this report but could potentially also include energy management companies that are not engaged directly with the generation of emissions but help others comply. A swap dealer is defined as an entity that deals primarily in swaps and may do so on the behalf of speculative traders or companies trying to reduce risk. In general, a money manager represents an entity that offers trading advice or manages futures trading for others. An investor without a compliance obligation would likely be classified as a money manager or potentially a swap dealer. In addition, if a trader has offsetting short and long positions, the associated quantity is included in a separate spread category. Finally, if a trader is not readily classified in a specific category, it is classified as “Other.” The assignment of an entity to a CFTC category may change over time depending on changing activities of the entity or new information.

Figure 8 shows the number of traders by the same CFTC trader categories described above except “Spread’ is included in “Other.” At least four entities must be included in a category for CFTC to report the number of traders in a category. For that reason, a category may appear in Figure 7 for a particular vintage but be absent from Figure 8 if there are not at least four distinct traders in the category. The sum of the number of traders within the long and short categories will typically exceed the total number of traders since a single trader may have both long and short positions. For more refined descriptions of the CFTC classifications, see www.cftc.gov.
Figure 7: Concentration of Open Interest in ICE Futures and Options by Type
January 1 to March 31, 2022

Figure 8: Number of Traders in ICE Futures and Options by Type
January 1 to March 31, 2022
Key observations regarding the participation by various categories of firms:

- The concentration of 2022 Vintage open interest long positions held by investment-oriented categories – money managed and swap dealers – fell from 61 percent at the beginning of the quarter to 56 percent by the end.
  - Swap dealers’ positions account for all of the decline in investment-oriented positions while managed money positions rose slightly over the time period. There was little change in the number of active traders among the groups; there were fewer than four swap dealers throughout the quarter while there were eleven managed money traders by the end of the quarter compared to ten at the start.
  - The swap dealer 2022 Vintage open interest position fell by 23 percent, while merchant/producers and managed money net long positions increased by 9 and 4 percent, respectively, during the quarter.
  - The decrease in swap dealer open interest accounted for 74 percent of the overall decrease in total open interest during the quarter.

- The concentration of 2022 Vintage open interest short positions held by swap dealers was large—79 percent or about 45 million allowances—at the end of the quarter, with just four traders in this category.

- The CFTC does not publish firm-level information on open interest, although the information they publish provides an indication of the upper limits of the net long and net short positions of individual firms. Combined with firm-specific information about CO₂ allowance holdings from COATS, the information on open interest that is published by the CFTC is useful for evaluating the potential for a firm to hoard RGGI CO₂ allowances, which is discussed further in Section E.
E. DISCUSSION OF MARKET MONITORING

As the RGGI Market Monitor, we monitor trading in the secondary CO₂ allowance market in order to identify anticompetitive conduct. Additionally, the Commodity Futures Trading Commission ("CFTC") evaluates trading in the secondary CO₂ allowance market consistent with its role as the regulator of derivative markets in the U.S. This section discusses two types of anti-competitive conduct for which we monitor. As in previous reports on the secondary market, we find no evidence of anti-competitive conduct.

In any commodity market, one potential concern is that a firm could hoard a substantial share of the supply of a commodity to influence prices or to prevent a competitor from obtaining CO₂ allowances. Hence, we screen information on the holdings of CO₂ allowances and allowance-derivatives and the demand for allowances to identify firms that might acquire a position that raises competitive concerns. The ability of an individual firm to hoard is limited by the substantial private bank of CO₂ allowances that has been accumulated and also by the market rules, particularly the auction rules that limit the amount of allowances that can be purchased by a single party or group of affiliated parties in a single offering to 25 percent.

Another potential concern is that a firm expecting to purchase CO₂ allowances in the auction might sell a large number of futures contracts in an effort to push the price of the contracts below the competitive level. Such a firm might profit from buying a large number of CO₂ allowances in the auction at a discount if the bidding in the auction were influenced by the depressed futures price. For this to be a profitable strategy, the firm would need to be able to substantially depress the futures price with a relatively small amount of sales—an amount smaller than the amount of CO₂ allowances it planned to buy in the auction. The best protection against this strategy is a market where other firms respond by making additional purchases. Firms that are looking for an opportunity to reduce their short positions or to purchase CO₂ allowances for their future compliance needs help limit the effectiveness of a strategy to depress prices below the competitive level. Nevertheless, the CFTC has access to confidential transaction data, which allows it to monitor for evidence of manipulative conduct.
